

SUMMARY OF THE INVENTION

A web page to be accessed next is selected by cursors independently operated by a plurality of users of an user terminal to which a plurality of pointing devices such as plural mouse, data tablet or the like are connected. If
5 a web page to be accessed next is competed among users, something adjustment such as a majority decision is applied to decide a web page. In some case, a plurality of user terminal shares the same web page, and each user terminal may be operated by more than one user using pointing devices. When competition
10 of a web page to be accessed next occurs, decision of a web page to be accessed next is done based on either user basis or user terminal basis.
